

```
Windows PowerShell
X Show the last 2 commits
$ git log --oneline -2
<exited with error: PowerShell 6+ (pwsh) is not available. Please install it from https://aka.ms/powershell. Error: Error: Command failed:
pwsh.exe --version
'pwsh.exe' is not recognized as an internal or external command,
operable program or batch file.
>

• Let me check your directory first and try a different approach:

X Check current directory
$ cd C:\Users\user && dir
<exited with error: PowerShell 6+ (pwsh) is not available. Please install it from https://aka.ms/powershell. Error: Error: Command failed:
pwsh.exe --version
'pwsh.exe' is not recognized as an internal or external command,
operable program or batch file.
>

• It looks like PowerShell 6+ isn't installed. To squash your last two commits, run:

git rebase -i HEAD~2

This will open an editor showing your last 2 commits. Change the second line from pick to squash (or s), save and exit. Then provide your new
commit message when prompted.

Which directory contains your git repository? I can help guide you through this if you let me know the path.

```
Windows PowerShell X + - X
• Signed in successfully as mary884! You can now use Copilot.

> auth

• Checking my documentation
  ↳ # GitHub Copilot CLI Documentation

• It looks like you're trying to authenticate. Based on the documentation, you can use the /login slash command to log in to Copilot with your GitHub account.

Run this command:

  /login

Or, if you prefer to authenticate with a Personal Access Token (PAT), set the GH_TOKEN or GITHUB_TOKEN environment variable with a fine-grained PAT that has the "Copilot Requests" permission enabled.

Is there something specific you'd like help with after authenticating?

> I committed locally but haven't pushed yet. I want to combine the last two commits into a single commit with a new message.

X Show the last 2 commits
$ git log --oneline -2
<exited with error: PowerShell 6+ (pwsh) is not available. Please install it from https://aka.ms/powershell. Error: Error: Command failed: pwsh.exe --version
'pwsh.exe' is not recognized as an internal or external command,
operable program or batch file.
>

• Let me try with standard PowerShell:

X Show the last 2 commits
$ git log --oneline -2
<exited with error: PowerShell 6+ (pwsh) is not available. Please install it from https://aka.ms/powershell. Error: Error: Command failed: pwsh.exe --version
```

Accuracy Ranking: 9/10

Justification:

GitHub Copilot accurately generated the correct Git command to squash the last two commits using interactive rebase and clearly explained the steps required to complete the task.
